Use case modeling is a modern approach for describing system requirements by focusing on "actors" to describe that interaction. In this course, you will learn how to utilize use case modeling to document functional requirements that can be understood and validated by all project stakeholders, including technical staff and business stakeholders, increasing the likelihood that stakeholder needs on a project are met.

What is Use Case Diagram?
Use case modelling is a useful tool for requirements elicitation. It provides a graphical representation of the software system's requirements. The key elements in a use case model are actors (external entities), and the use cases themselves.

Use Case Modelling
Use case modeling typically starts from identifying key stakeholder roles (actors) interacting with the system, and their goals or objectives the system must fulfill (an outside perspective). These user goals then become the ideal candidates for the names or titles of the use cases which represent the desired functional features or services provided by the system.
